TASK 2.5

I decided to add a preparation time attribute and use that to define the difficulty of each recipe, as I believe the preparation is a more accurate reflection of a recipe's difficulty. On second thoughts I went back to using cooking_time with ingredients, as generally the more ingredients, the more work.
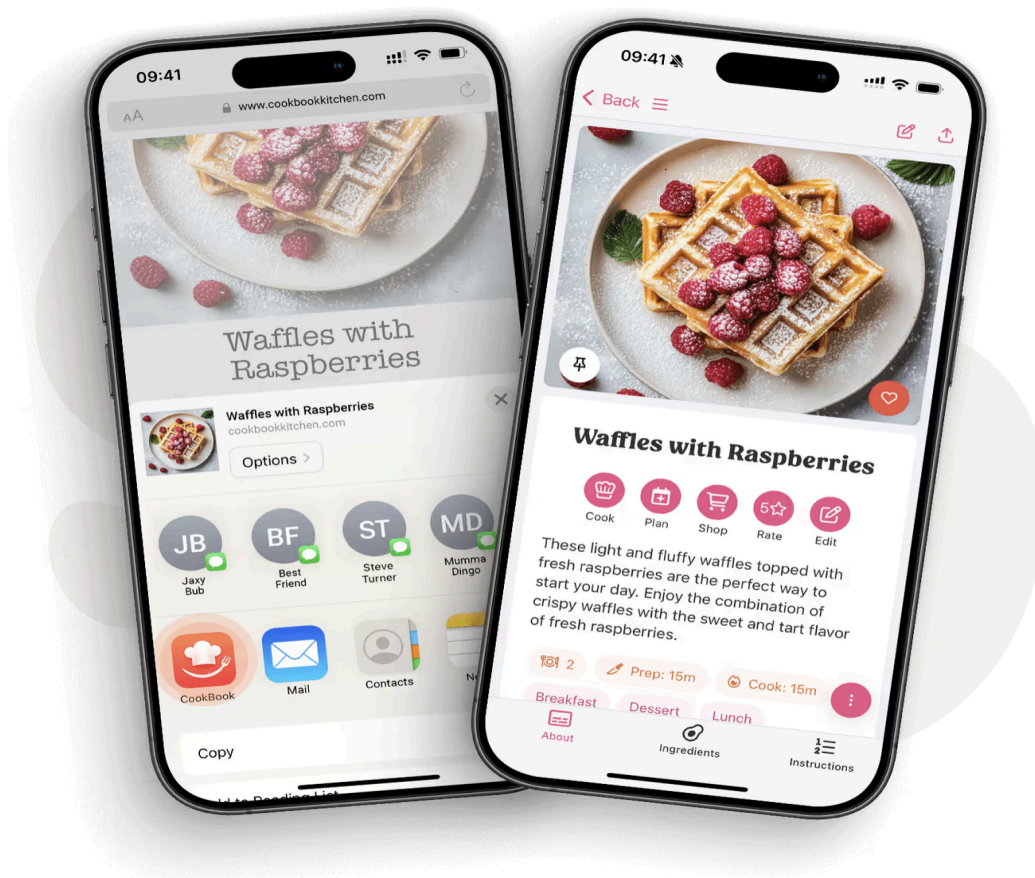

I also added a "meal_type" attribute (breakfast, lunch, dinner, snack, drink, dessert), with a search option to add to the search by ingredient option. I think this is convenient for users looking for a particular meal for the time of day.

In task 2.4 I also added "description" and "instructions" fields to the recipe model. As I feel any recipe app needs instructions. Without them, it is just static information about ingredients in any dish.

Cook Book Manager
https://cookbookmanager.com/

The layout is clean and intuitive, with nice images and icons. It is for mobile and web as well.

Recipe Keeper and Meal Planner
Recipe Keeper & Meal Planner

Great features including share from other apps, scan a recipe to save and create your own printable pdf cookbooks. Intuitive UI/UX, the design has less appeal than some others but still good.
